Assignment 5

-Changes for final project

Link to Web: https://ivresse-i.github.io/finalwork/
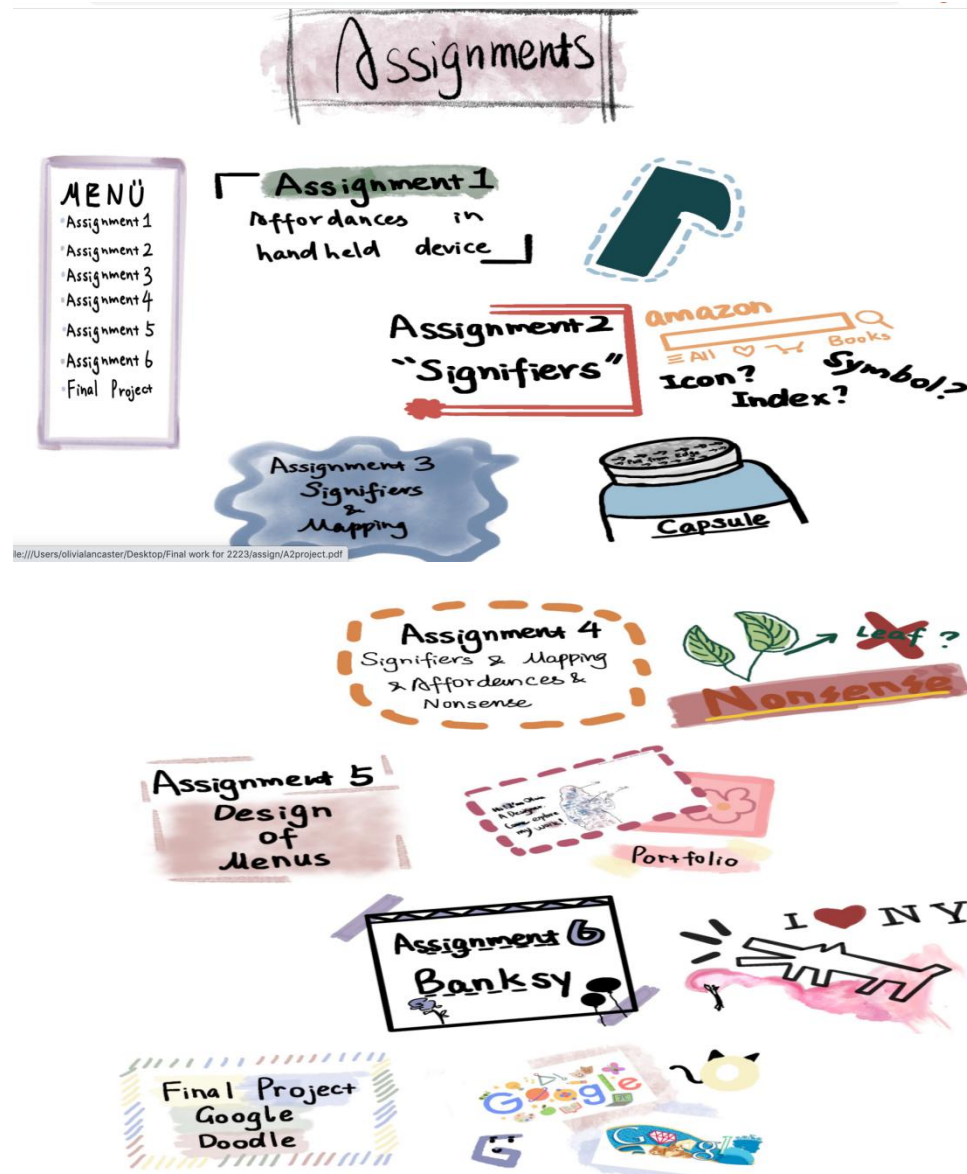

For the final version of the project before submission, I changed the page of Assignments by adding more elements of hand paintings.

On the right side of the assignments' topics, I drew several images for every assignment to present or connect to the themes of each assignment. By seeing these images, people can know the brief contents before seeing the final assignments. I changed it since I thought these images were more closer to the topic of assignments and the paintings were same style with my portfolio.
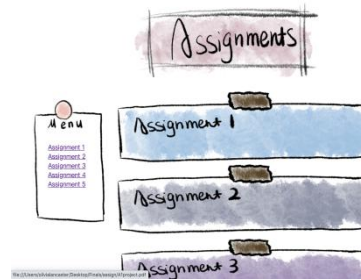

-Final project

1.Overview of final project
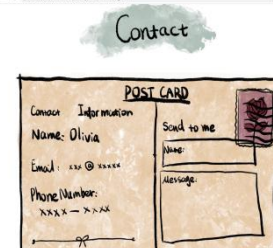

(Main page/landing page) (Assignment page)

(About me page) (My skill page) (Contact page)

For the final project, I used more hand-drawing elements in the website to make it unified. Also, I used many colors to make my website become more attractive. I tried to unify the styles of each web page.

2.Landing page

In the first landing page, the "ideas", "love" and "skills" could link with the page of "Assignment page", "About me page" and "Contact" page. Besides, I used heart, bulb and pen as the symbols to indicate with skills, love and ideas. I added colors in "self-character" in the landing page since I wanted to use the colorful printings to represent the imaginations and my diverse personalities. Besides, I added the cat and

book part in the right side of website to avoid too much blank spaces and both of these two things also were two of the interest of me (I'm a cat-lover and I like reading book on the free time). In the upper right part, I putted some index to guide readers (About my work, About me, My skill and Contact).

3.Assignment page
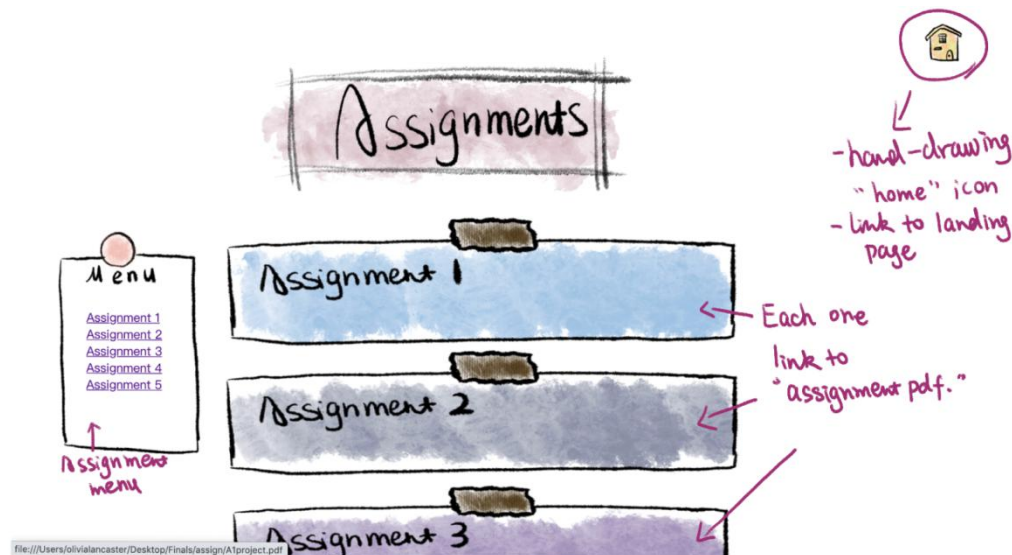

In the assignment page, I redesigned assignment page by using the clip art elements and hand paintings in both assignment and menu part. Also, I used a hand-painted and colorful homepage icon for linking to the homepage. Each assignment would link to the different projects' PDF versions. The assignment page looked like writing journals.

4.Making the web
I used HTML and CSS to design the websites and created a folder to include all the documents, html, css and images.
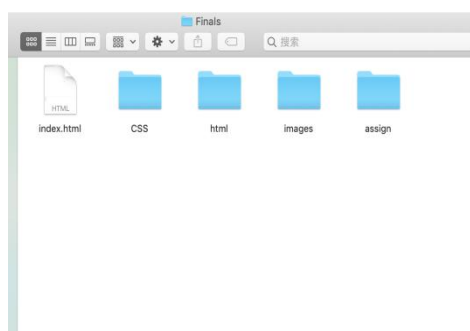

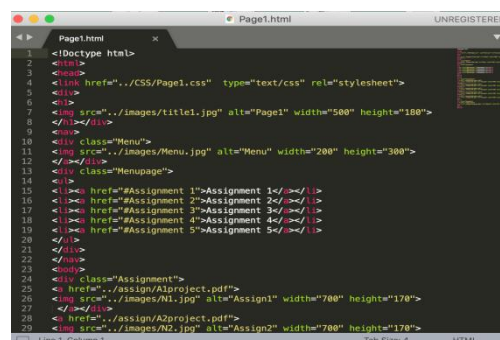

(Folder)   (E.g. Part of html)

-XD Lay Out

(overview of first XD)

For the XD Menu, I made my draft become more colorful as landing page of my website since the previous sketch was blank and a little bit boring. Also, I added the hand part as "skill" which changed from the first sketch.

For the assignment part, I designed the simple box for each assignment. For each page, I also added the homepage icon to link the landing page with each page.

However, one thing which I found I would change in the further work was icons of homepage since my main style for the project was hand-painting. Thus, I might use hand-drawing to design the icon to make the similar style for the web page. Finally, I found that each page of my XD had different styles and I would consider it in the further project to make it become more unified.

-Draft (Simple sketch)

My initial idea about this project is based on my interest since I love drawing on the iPad before and I think it also can represent part of my personality. Thus, I will use many hand-drawing elements in the website.
